

TapestryHealth provides long term care centers with a safety net of technology and clinical experts to help them provide more proactive, personalized care to each resident. We help the busy nurses and doctors have up to the minute clinical information for each resident so that they see changes in health status and take action before a resident's condition worsens and requires hospitalization.

Notably, long term care centers that have worked with TapestryHealth for 12 months or more have seen a **43% reduction in Emergency Room visits** and a **45% reduction in hospitalizations** for their residents!

Our solutions include Daily Risk Reports, Chronic Care Management Reports, and Remote Physiologic Monitoring. The Centers for Medicare and Medicaid Services (CMS) has recognized these services as a critical health care service that contributes to better health and more timely care.

#### **TAPESTRY HEALTH SOLUTIONS:**

##### **Chronic Care Management (CCM)**

Chronic Care Management provides facilities with a Daily Risk Report that prioritizes residents who are most at-risk for needing hospitalization. Chronic Care Management assesses medications, vital signs, daily activities, falls, weight, and other health status indicators. Each patient's monthly report has an individualized care plan recommendations for the long-term care center and community providers to follow. It provides updates on the resident's progress on care plan goals.

##### **Remote Physiologic Monitoring (RPM)**

Our Remote Physiologic Monitoring is a touchless vital sign monitoring system. Our devices continuously collect pulse and respiration rate data which can be early indicators of a change in health status – in **real time**. Changes in vital signs are reviewed by our remote team of nurses. When they see changes that might be early indicators of declining health status, they contact the on-site care team. RPM detects small changes which often go undetected. We provide peace of mind for residents, their families, and the onsite care team. Our devices use radar wave technology with **no cameras or microphones**. Data is secure and protected to maintain privacy.

We help facilities treat patients faster and onsite, so that ED visits and hospitalizations can be avoided – or if hospitalization is needed --the problem is identified earlier.

TapestryHealth *does not replace physicians, nurses, or anyone on the care team*. We assist caregivers by providing additional support through data-driven, proactive care management and coordination of care.
